#### Abstract

Treatment of cycloalkanones 1a-c with benzalaniline or dibenzal-p-phenylenediamine gave the corresponding cycloalkanone sec-Mannich bases $\mathbf{2 a} \mathbf{a}$ and 4 .Whereas, the reaction of $\mathbf{1 a}$ or $\mathbf{b}$ with benzal-1naphthylamine afforded the condensed systems 7 and $8.2,6$-di( $p$-anisal)cyclohexanone (10) was obtained from 1b and $N, N^{\prime}$-bis( $p$-anisal)ethylenediamine $9 . O n$ the other hand, treatment of the bis-(Mannich base) 12 with benzalaniline gave the mixed Mannich base 13. The tetra-base 14 was obtained by treating $\mathbf{2 b}$ with ammonium chloride and formaldehyde, or from the tris-(Mannich base) 15 and benzalaniline.Schmidt reaction of $\mathbf{2 a - c}$ and 4 gave $N$-phenyl- $\alpha$-aminobenzyl derivatives of piperidin-2-one 16, azepan-2-one 17, azocan-2-one 18 and the bis-(azepan-2-one) derivative 19, respectively. The potential of compounds 16 and 17 as precursors to fused heterocycles containing a nitrogen atom at a ring-junction was investigated. The 1,2,4-triazepine derivatives 25 and $\mathbf{2 6}$ were obtained by treating $\mathbf{2 a}, \mathbf{b}$ with hydrazine and formaldehyde. Key words: Mixed Mannich Bases, Schmidt reaction, Rin-junction nitrogen, 1,2,4-Triazepines

## INTRODUCTION

There is currently a great deal of interest in the chemistry of Mannich bases due to their wide range of biological and pharmacological activities. Several Mannich bases derived from cycloalkanones were prepared and studied from the pharmacological point of view [1-7]. Chemothera peutically valuable compounds in this class are a series of Mannich bases, such as spiractin "respiratory stimulant" [8], oxazidione "anticoagulant" [9], Be-2254 "antihypertensive" [10, 11], and moban "neuroleptic" [12, 13]. In addition, tert-Mannich bases of cycloalkanones are of considerable importance as intermediates in the synthesis of condensed heterocyclic systems [3, 14-17], and of heterocycles of alkaloidal nature [18-23]. However, the use of sec-Mannich bases as synthetic intermediates has been reported in a limited number of cases [24,25].

In connection with our studies in the area of Mannich bases and related compounds [16, $17,20-23,26,27]$, the synthetic potential cycloalkanone sec-Mannich bases of the type 2 as intermediates for the synthesis of the title compounds was investigated,

## MATERIALS AND METHODS

## Experimental Section

All melting points (uncorrected) were determined on a Gallenkamp electric melting point apparatus. Elemental microanalyses were carried out at the Microanalytical Unit, Faculty of Science, Cairo University. Infrared spectra were measured on a Mattson 5000 FTIR spectrometer. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data were obtained in $\mathrm{CDCl}_{3}$ or $\left[\mathrm{D}_{6}\right]$ DMSO solution on a Varian XL 300 MHz instrument using TMS as internal standard. Chemical shifts are reported in ppm ( $\delta$ ) downfield from internal TMS. Mass spectra were recorded on a GC-MS QP -1000 EX Shimadzu instrument. The course of the reaction and the purity of the synthesized compounds were monitored by TLC using EM science silica gel coated plates with visualization by irradiation with an ultraviolet lamp. Compounds 14,16 and 19 are of limited solubility in common ${ }^{1} \mathrm{H}$ NMR solvents.

## $\mathrm{N}, \mathrm{N}^{\prime}$-Bis [ $\alpha$-(cyclohexanon-2-ly) benzyl]-p-phenylenediamine (4)

A solution of $\mathbf{1 b}(2.15 \mathrm{~g}, 22 \mathrm{mmol})$ and dibenzal-p-phenylenediamine ( $2.84 \mathrm{~g}, 10 \mathrm{mmol}$ ) in ethanol ( 40 mL ) and two drops of conc. HCl was heated on a water bath at $45-50^{\circ} \mathrm{C}$ for 3 min . After standing at r . t . for 12 h and neutralization with $\mathrm{NH}_{4} \mathrm{OH}$, the product was filtered and crystallized from ethanol to give 4. ## RESULTS AND DISCUSSION

In the present study, the 2-[ $\alpha$-( $N$-phenylamino) benzyl]cycloalkanones 2a-c were prepared by treating the appropriate cycloalkanone 1a-c with benzalaniline in presence of hydrochloric acid as previously described [28-30]. The scope of this reaction has been broadened by treating $\mathbf{1 b}$ with dibenzal- $p$-phenylenediamine (3) to give $N, N^{\prime}$-bis $[\alpha$ -(cyclohexanon-2-ly)benzyl]-p-phenylenediamine (4). Whereas, the reaction of $\mathbf{1 a}$ and $\mathbf{1 b}$ with benzal-1-naphthylamine takes a different course. The reaction proceeded smoothly to give 6-phenyl-6,7,8,9-tetrahydro-5 H -benzo[ $h$ ]cyclopenta[c]quinoline (7) and 6-phenyl-5,6,7,8,9,10-hexahydro-benzo[c]phenanthridine (8), respectively, via the intermediacy of 6 ( $n=1$ or 2 ), which undergoes cyclization to give $\mathbf{7}$ and 8 as the end products (Scheme 1). The mass, IR and ${ }^{1} \mathrm{H}$ NMR spectra of compounds $\mathbf{4}, \mathbf{7}$, and $\mathbf{8}$ are consistent with their structures. The formation of
compounds $\mathbf{7}$ and $\mathbf{8}$ is in line with an earlier report [31] in which 2-phenyl-5,6-benzolepidine was obtained by the acid catalyzed condensation of benzal-2-naphthylamine with acetone. The IR spectra of $\mathbf{7}$ and $\mathbf{8}$ revealed the absence of carbonyl groups and showed strong bands at 3345 and $3360(\mathrm{NH})$, respectively.

Scheme 1.

Treatment of $\mathbf{1 b}$ with $N, N^{\prime}$-bis( $p$-methoxybenzylidene)ethylenediamine (9) afforded 2,6-di(p-methoxybenzal)cyclohexanone (10). The formation of $\mathbf{1 0}$ rather than the expected bis-(secMannich base) $\mathbf{1 1}$ may be attributed to the reaction of $\mathbf{1 b}$ with $p$-anisaldehyde resulting from
decomposition of 9 . This result parallel the reported formation of 2 -(p-methoxybenzal)-1,3indandione from 9 and 1,3-indandione [32].

On the other hand, the reaction of the bis-(tert-Mannich base) 12 [33] with benzalaniline is of particular interest, because it offers access to the mixed Mannich base; $\mathrm{N}, \mathrm{N}$ -bis[3-( $\alpha$-phenylaminobenzyl)-2-oxocyclohexylmethyl]methylamine (13).

Scheme 2.

In connection with this study, the synthesis of tri-[3-( $\alpha$-phenylaminobenzyl)-2oxocyclohexylmethyl]amine (14) has been achieved by Mannich reaction of $\mathbf{2 b}$ with ammonium chloride and formaldehyde. The unambiguous synthesis of the mixed Mannich base 14, by treating the tris-(Mannich base) 15 [33] with benzalaniline confirmed its structure (Scheme 2). The mass spectra of $\mathbf{1 3}$ and $\mathbf{1 4}$ contain peaks of the respective molecular ions, and fragmentation patterns which supported their structures. The fragmentation pattern of 14 is depicted in Scheme 3.

## Scheme 3.

One of the specific objectives of this study was to investigate the possible synthesis of saturated NH -heterocycles from the cycloalkanone sec-Mannich bases $\mathbf{2 a}$-c and $\mathbf{4}$, because the introduction of a cyclic NH group besides the sec-arylamino functionality, offers the possibility to form several fused heterocycles. The Schmidt reaction with $\mathbf{2 a - c}$ and $\mathbf{4}$ constitutes an interesting and useful approach towards this goal. This has been realized by treating 2a-c with one equivalent of hydrazoic acid to give the ( $N$-phenylamino) benzyl derivatives of piperidin-2one (16), azepan-2-one (17) and azocan-2-one (18), respectively. A similar reaction takes place on treating 4 with two equivalents of hydrazoic acid yielding $N, N^{\prime}$-bis[ $\alpha$-(azepan-2-one-7-yl)benzyl]-p-phenylenediamine (19) (Scheme 4).

Scheme 4.

The assignment of the ( NH ) group between the $(\mathrm{C}=\mathrm{O})$ group and the substituted carbon atom of $\mathbf{1 6 - 1 9}$ is based on previous studies on the Schmidt reaction with tert-Mannich bases of cycloalkanones [17, 20, 34]. In addition, there is much evidence that bulky substituents at the $\alpha$-position exert stereocontrol on the Schmidt reaction [21, 22, 35, 36].

In order to explore the synthetic potentialities of compounds 16-18 as intermediates for the synthesis of fused heterocycles containing a nitrogen atom at a ring junction, compound 16 was treated with formaldehyde to afford 1,2-diphenylhexahydroimidazo[1,5-a]pyridine$5(1 \mathrm{H})$-one (20). The double Mannich reaction of 16 with cyclohexylamine and formaldehyde provides a convenient access to the octahydropyrido[1,2-e][1,3,5]triazepin-7(1H)-one ring system (21). In addition, 4,4-diethyl-1,2-diphenylhexahydropyrido[1,2-a][1,4]diazepine-3,5,7$\left(4 \mathrm{H}\right.$ )-trione (22) was obtained by treating 16 with diethyl diethylmalonate. The mass, IR and ${ }^{1} \mathrm{H}$ NMR spectra of compounds 19-21 are consistent with their structures (Scheme 5).

Scheme 5.

On the other hand, the reaction of 17 with formaldehyde afforded 6-methylene-1,2-diphenylhexahydro-1H-imidazo[1,5-a]azepin-5(6H)one (23). Whereas, the synthesis of the decahydroazepino $[1,2-c][1,3,6]$ oxadiazepine ring system (24) has been achieved via a reaction sequence which involves reduction of 17 and subsequently treatment with excess formaldehyde under slightly acidic conditions (Scheme 6). The mass spectra of 23 and 24 revealed molecular ion peaks at $m / z=318$ and 322 , respectively. The main characteristic features of the ${ }^{1} \mathrm{H}$ NMR spectrum of 24 are two singlets at $\delta=5.85$ and 6.05 assignable to $5-\mathrm{H}_{2}$ and $3-\mathrm{H}_{2}$, respectively. The formation of 24 is in line with an earlier report [37], in which 4-alkyl-1,3,4,5-tetrahydro-1,3,6-oxadiazepino[3,4-a]benzimidazole is obtained from 2alkylaminomethylbenzimidazole and formaldehyde.

Scheme 6.

In an extension of this study, the ketonic sec-amine 2a was treated with hydrazine and subsequently with formaldehyde under mild conditions to give $2,3,4,5,5 a, 6,7,8$-octahydro-4,5-diphenylcyclopenta[f][1,2,4]triazepine (25). A similar reaction takes place on treating the hydrazone of $\mathbf{2 b}$ with formaldehyde yielding octahydro-4,5-diphenyl-2Hbenzo[f][1,2,4]triazepine (26) (Scheme 7). A practical advantage of the reactions leading to compounds $\mathbf{2 5}$ and $\mathbf{2 6}$ is that it is often unnecessary to isolate the intermediate hydrazones.
