## Synthesis and Antibacterial Evaluation of Bis-pyrrolidinyl Ketones

AA AI-Kadhimi ${ }^{{ }^{*}}$, AJ AL-Hamdany ${ }^{2}$, SS Jasim ${ }^{3}$<br>${ }^{1}$ Department of Chemistry, College of Science, University of Tikrit, Iraq<br>${ }^{2}$ Department of Chemistry, College of Science, University of Mosul, Iraq<br>${ }^{3}$ Fuel \& Energy Department, Technical College, Kirkuk, Iraq

#### Abstract

A series of novel bis-pyrrolidines (9-14) were prepared by the reaction of two moles of Schiff's bases (7 \& 8 ) in a 1,3-anionic cycloaddition manner with substituted ( $1 E, 4 E$ )-1,5-diphenyl-1,4-pentadien-3-one (1-4). All new compounds were characterised using ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}-\mathrm{NMR}, \mathrm{IR}, \mathrm{UV}$ and elemental analysis. The antibacterial activity of some of these compounds was also evaluated. The proposed reaction mechanism was investigated using theoretical methods such as heat of formation (H.F.) and steric energy (S.E.) calculation. MOPAC, (H.F.) and MM2 methods were also used in this study.

Keywords: 1,3-anionic cycloaddition, Bis-pyrrolidinyl Ketones, Schiff's bases, Staphylococcus aureus

## INTRODUCTION

Pyrrolidines play an important role in medicinal and pharmaceutical chemistry. These compounds show biological activities such as analgesic potency [1], antibacterial [2], dipeptidyl4 peptidase inhibitors [3], histamine $\mathrm{H}_{3}$-receptor ligands [4], antimicrobial [5], and antitumor [6]. Some pyrrolidines also act as potent $\mathrm{H}_{3}$-antagonists [7].

The value of the pyrrolidines and their $N$-substituted analogues is not limited to the use of these compounds, but they can also be used as precursors for building other important compounds. These compounds undergo typical reactions of secondary or tertiary alkyl amines. Therefore, these compounds can be alkylated, acylated and nitrosated [8].
Mikhova et al [25] and Popandova-Yambolieva et al [26] prepared several of these pyrrolidinyl ketones. They [25, 26] also studied the stereochemistry and the NMR spectroscopy of these compounds in detail (Scheme 1).

We would like to report herein the synthesis of bis-pyrrolidinyl ketones, their ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$ NMR as well as their antibacterial activity.

## MATERIALS AND METHODS

## Experimental

General: Ultra-violate spectra (UV) were obtained using Shimadzu UV-VIS spectrometer UV-160 and JASCOW32 (UV-VIS) spectrometer V-500, $\mathrm{CHCl}_{3}$, Scale 200-800nm. Infrared spectra were recorded on Shimadzu FT 8400 S , Fourier Transform-Infrared Spectrometer in Tikrit University/Iraq. Proton Nuclear Magnetic Resonance ( ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ) and Carbon Nuclear Magnetic Resonance ( ${ }^{13} \mathrm{C}-\mathrm{NMR}$ ) spectra were recorded on Brucker ( 400 MHz ) using tetramethylsilane (TMS) as an internal standard, and $\mathrm{CDCl}_{3}$ as a solvent in AL-Baath University/Syria and on Brucker ( 500 MHz ) using tetramethylsilane (TMS) as an internal standard, and DMSO-d ${ }_{6}$ as a solvent were performed in Technische University/Germany. The elemental analyses were recorded on C.H.N. Elemental analyser "FIASH AE1112 in Technische University/Germany.

## Computational Work

In the present work, the CS ChemOffice (version 6.0) was used for the computational work.

## Synthesis of Diaryledene acetone

Typical procedure for the synthesis of compounds (1-4) [9]:
A solution of acetone ( $1.4 \mathrm{~g}, 25 \mathrm{mmol}$ ) and benzaldehyde [( 50 mmol ) or substituted benzaldehyde] was added dropwise with stirring at room temperature to a stirred solution of sodium hydroxide ( $5 \mathrm{~g}, \mathrm{mmol}$ ), in [water ( 50 mL ) and ethanol ( 40 mL )]. The stirring was continued for 30 min at room temperature. The resulting precipitate was filtered, washed with
cold water ( $3 \times 30 \mathrm{~mL}$ ) and dried. Recrystallization from ethanol (95\%) afforded the required product. Melting point, yield and colour of these compounds are compiled in Table (1).

## Synthesis of Schiff's bases

Typical procedure for the synthesis of compounds (5-8) [10]:
Benzylamine ( $800 \mathrm{mg}, 10 \mathrm{mmol}$ ) and benzaldehyde (or substituted benzaldehyde) were dissolved in $n$-butanol $(10 \mathrm{~mL})$ and heated at $\left(100^{\circ} \mathrm{C}\right)$ for 10 min . The cold reaction mixture was filtered and dried. The product was purified by distillation at atmospheric pressure. For melting point / boiling point, yield and the colour of these compounds see (Table 2).

## Synthesis of Dipyrrolidinyl Ketone (9-15)

Typical procedure for the synthesis of compounds (9-15) [11]:
A mixture of Schiff's bases (5-8) ( 5 mmol ), diarylidene acetone ( $9-15$ )( 2.5 mmol ), tetrabutylammonium bromide (TBAB) ( $0.12 \mathrm{~g}, 0.5 \mathrm{~mol}$ ), sodium hydroxide ( $50 \%, 3 \mathrm{~mL}$ ) and dimethyl sulphoxide (DMSO) ( 10 mL ) was stirred at room temperature for 1 h . The separated product was filtered, washed with water until the filtrate became clear and neutral, and then the product was dried and recrystallized from methanol / ethyl acetate. For the physical properties see (Tables 3a and 3b).

## RESULTS AND DISCUSSION

## [1] Condensation of substituted benzaldehyde with acetone

Substituted benzaldehydes were condensed with acetone using Claisen-Shmidt condensation methodology in the presence of sodium hydroxide. This reaction gave rise to the required products (1-4) (Scheme 2). This was similar to the work of Mikhova et al [25], Khalaf et al $[27,28]$ and Popandova-Yambolieva et al [26] (Scheme 1) in which they synthesised substituted (2E)-1,3-diphenyl-2-propen-1-ones.

Scheme 1. Synthesis of substituted (2E)-1,3-diphenyl-2-propen-1-one

These compounds (1-4) were fully characterised using ${ }^{1} \mathrm{H}-\mathrm{NMR},{ }^{13} \mathrm{C}-\mathrm{NMR}, \mathrm{IR}, \mathrm{UV}$, and microanalysis, (Table 4). These compounds were prepared as illustrated in (Scheme 2) analogous to the method in (Scheme 1).

Scheme 2. Synthesis of substituted (1E,4E)-1,5-diphenyl-1,4-pentadien-3-one.
The infra red (IR) spectra of these compounds (1-4) showed strong absorption bands at (1650-1681 $\mathrm{cm}^{-1}$ ) which represent the stretching vibration of the carbonyl group ( $\mathrm{vC=O}$ ) [12]. The conjugation of carbonyl group with ( $C=C$ ) bond resulted in the delocalization of the carbonyl group with the ( $C=C$ ) bond which led the absorption to shift to a lower frequency [13]. The bands at (1606-1589 $\mathrm{cm}^{-1}$ ) represent ( $\mathrm{C}=\mathrm{C}$ ) stretching vibration ( $\mathrm{vC}=\mathrm{C}$ ) and the bands at ( $1560-1492 \mathrm{~cm}^{-1}$ ) represent aromatic ring stretching vibration ( $\nu \mathrm{C}=\mathrm{C}$ ).

The ${ }^{13} \mathrm{C}$ NMR spectrum of compound (2) showed a peak at $\delta(55.82) \mathrm{ppm}$ due to the methoxy carbon at the ortho position in the two rings; another peak at $\delta(56.10) \mathrm{ppm}$ was attributed to the methoxy carbon at the meta position in the two rings [14]. There are four peaks at $\delta(112.43) \mathrm{ppm}, \delta(113.17) \mathrm{ppm}, \delta(117.19) \mathrm{ppm}$, and $\delta(124.46) \mathrm{ppm}$, which represent the $o, p, m$ carbon atoms attached to the two olefinic carbon at $C_{2}$ and $C_{4}$. There is a peak at (138.07)ppm attributed to the ortho carbon attached to the methoxy group of the two rings. The peak at $\delta(153.12) \mathrm{ppm}$ referred to the olefinic carbon at $\mathrm{C}_{1}$ and $\mathrm{C}_{5}$, while the peak at $\delta(153.50) \mathrm{ppm}$ referred to the meta carbon attached to the methoxy group of the two rings; finally the peak at $\delta(189.58) \mathrm{ppm}$ was due to the carbonyl carbon [15]. ${ }^{13} \mathrm{C}$ NMR data of compounds (1, 2, 13) are summarized in (Table 8).

The ${ }^{1} \mathrm{H}$ NMR data of compound (2) are in (Table 9). The (UV) spectra showed a $\left(\lambda_{\max }\right)$ in the range of (312-390) nm, which seemed in good agreement with the analogous ( $1 E, 4 E$ )-1,5-diphenyl-1,4-pentadien-3-one [16], due to the conjugation of carbonyl group with the double bond and the spectrum showed red shift (bathochromic shift).

## [2] Condensation of Benzaldehydes with Benzylamines

Benzaldehydes were condensed with benzylamine to afford substituted Schiff's bases (5-8) (Scheme 3).

Scheme 3. Preparation of Schiff's bases

Schiff's bases were identified according to the spectroscopic data obtained (Table 5). IR spectra showed strong absorption bands at $\left(1650-1641 \mathrm{~cm}^{-1}\right)$ which represents the stretching vibration of the ( $v \mathrm{C}=\mathrm{N}$ ) bond [17], while the bands at $\left(1600-1440 \mathrm{~cm}^{-1}\right)$ related to the aromatic ring stretching vibration ( $v C=C$ ). The (UV) spectra showed a $\left(\lambda_{\max }\right)$ in the region of (306-313 nm ), which were in good agreement with analogous Schiff's bases [18].

## [3] Condensation of Schiff's bases with (1E,4E)-1,5-diphenyl-1,4-pentadien-3-one

Compounds (9-14) were identified on the basis of spectroscopic evidence (Table 6). The IR spectra exhibited bands in the range of (1705-1700 $\mathrm{cm}^{-1}$ ) corresponding to the carbonyl group stretching vibration ( $v \mathrm{C}=\mathrm{C}$ ) [19], while the weak absorption bands in the range of (3429$3326 \mathrm{~cm}^{-1}$ ) were related to the stretching vibration of ( $\mathrm{N}-\mathrm{H}$ ).

The ( ${ }^{1} H-N M R$ ) spectrum of compound (13) showed a peak at $\delta(2.14)$ ppm integrated for 2 H , which attributed to the protons of the two nitrogen atoms. The peak at $\delta(2.85) \mathrm{ppm}$ integrated for 2 H corresponds to the protons at $\mathrm{C}_{3} \& \mathrm{C}_{3}{ }^{\prime}$ of the two pyrrolidine rings. The other peak at $\delta(3.25) \mathrm{ppm}$ integrated for 2 H corresponds to the protons at $\mathrm{C}_{4} \& \mathrm{C}_{4}{ }^{\prime}$ of the two pyrrolidine rings. The peak at $\delta(3.58) \mathrm{ppm}$ integrated for 2 H corresponds to the protons at $\mathrm{C}_{2} \&$ $\mathrm{C}_{2}{ }^{\prime}$ of the two pyrrolidine rings. The other peak at $\delta(3.83) \mathrm{ppm}$ integrated for 2 H corresponds to the protons at $\mathrm{C}_{5} \& \mathrm{C}_{5}{ }^{\prime}$ of the two pyrrolidine rings. Finally, a doublet at $\delta(6.43) \mathrm{ppm}$ and the multiplet at $\delta(6.82-7.49) \mathrm{ppm}$ integrated for 28 H corresponding to the aromatic protons.
${ }^{13} \mathrm{C}-\mathrm{NMR}$ spectrum of compound (13) shows a peak at $\delta(58.33) \mathrm{ppm}$ attributed to the carbon of the two methoxy groups. There are four peaks at $\delta(62.08,65.33,65.80$ and 70.52$)$ ppm corresponding to $\left(C_{3} \& C_{3}{ }^{\prime}\right),\left(C_{2} \& C_{2}{ }^{\prime}\right),\left(C_{4} \& C_{4}{ }^{\prime}\right)$ and $\left(C_{5} \& C_{5}{ }^{\prime}\right)$ of the two pyrrolidine rings respectively. A peak at $\delta(116.54) \mathrm{ppm}$ referred to the meta carbons of the two rings attached to the methoxy groups. The peak at $\delta(118.27) \mathrm{ppm}$ was due to the para carbons of the phenyl rings at $\mathrm{C}_{2}, \mathrm{C}_{2}{ }^{\prime}, \mathrm{C}_{5}$ and $\mathrm{C}_{5}{ }^{\prime}$ of the two pyrrolidine rings. The two peaks at $\delta(130.40) \mathrm{ppm}$ and
$\delta(130.70)$ ppm referred to the ortho carbons of the phenyl rings at $C_{2}, C_{2}{ }^{\prime}, C_{5}$ and $C_{5}{ }^{\prime}$ while the peak at $\delta(133.02) \mathrm{ppm}$ corresponding to the two carbons of the two phenyl rings attached to pyrrolidine rings at $\mathrm{C}_{4}, \mathrm{C}_{4}{ }^{\prime}$. The peak at $\delta(142.60) \mathrm{ppm}$ due to the four carbons of the four phenyl rings attached with pyrrolidine rings at $C_{2}, C_{2}^{\prime}, C_{5}$ and $C_{5}^{\prime}$ as well as the $\delta(160.02) \mathrm{ppm}$ attributed to the para carbons of the two phenyl rings containing the methoxy groups, and finally, the peak at $\delta(203.34) \mathrm{ppm}$ was attributed to the carbonyl carbon [20].

The (UV/VIS) spectra (Table 6) of the products showed a ( $\lambda_{\max }$ ) in the range of (365420) nm indicating a red shift. The observed red shift may be attributed to the presence of additional aromatic rings [21]. The elemental analysis of compound (13) showed a considerable agreement with the calculated values of this compound (see Table 10). For mp, yield, colour and nomenclature see (Tables 1, 2, 3a and 3b).

The suggested mechanism [22] for the 1,3-anionic cycloaddition reaction of two moles of Schiff's base and ( $1 E, 4 E$ )-1,5-diphenyl-1,4-pentadien-3-one was initiated by the abstraction of the more acidic proton from Schiff's base to afford two moles of the anion $\mathrm{An}_{1}$ or $\mathrm{An}_{2}$ and the delocalization of the negative charge on $A n_{1}$ or $A n_{2}$ giving rise to the resonance hybrid $A n_{3}$ (Scheme 4), which in turn may attack the two double bonds of the $\alpha, \beta$-unsaturated system via 1,3-anionic cycloaddition to afford one of four possible structures: $a, b, c$, or $d$. Depending on the values of (H.F) (Table 7). It can be concluded that the final products are those having the lowest values of (H.F) as shown in (Scheme 4).

## Biological Evaluation

The biological inhibitory effects of certain products such as (DAA)(2), Schiff base (6) and pyrrolidine (13) against five types of bacterial groups such as Gram-negative E. coli, Proteus
vulgaris, Bacillus subtilis, Klebsiella pneumonia and Gram-positive, such as Staphylococcus aureus, were investigated (Table 11).

The standard Kirby and Bauer [23] method was used. Aliquot of each bacterial species was cultured in nutrient broth and incubated at $\left(37^{\circ} \mathrm{C}\right)$ for (14-16h) and then evenly distributed on the nutrient agar by using a sterile swab. The plates were incubated at $\left(37^{\circ} \mathrm{C}\right)$ for ( 30 min ) and the filter paper (Whatman No. 1 discs) were distributed on the agar and an amount equal to ( $1 \mathrm{mg} / 1 \mathrm{~mL}$ ) or ( $1 \mathrm{~mL} / 1 \mathrm{~mL}$ ) of the compound per solvent (DMSO) was added. Tetracycline and Gentamycine were used as control.

The plates were then incubated at $\left(37^{\circ} \mathrm{C}\right)$ for $(18-24 \mathrm{~h})$. The interpretation of the results based on the diameter ( mm ) of the inhibition zone appeared around the disc [24]. The results were interpreted according to the report of (W.H.O.).
(A): The resistance (R) result represented the diameter of inhibition < (11) mm.
(B): The moderately sensitive (MS) result was regarded when the zone inhibition was between
(12-16) mm.
$(\mathrm{C})$ : The sensitive $(\mathrm{S})$ result was over (16) mm .
